

<b>Name:</b> John Era Roldan	<b>Date Performed:</b> 5/09/2025
<b>Course/Section:</b> CPE212 CPE31S2	<b>Date Submitted:</b> 5/09/2025
<b>Instructor:</b> Engr. Robin Valenzuela	<b>Semester and SY:</b>
<b>Activity 3: Install SSH server on CentOS or RHEL 8</b>	
<b>1. Objectives:</b> <ul style="list-style-type: none"> <li>1.1 Install Community Enterprise OS or Red Hat Linux OS</li> <li>1.2 Configure remote SSH connection from remote computer to CentOS/RHEL-8</li> </ul>	
<b>2. Discussion:</b> <p><b>CentOS vs. Debian: Overview</b></p> <p>CentOS and Debian are Linux distributions that spawn from opposite ends of the candle.</p> <p>CentOS is a free downstream rebuild of the commercial Red Hat Enterprise Linux distribution where, in contrast, Debian is the free upstream distribution that is the base for other distributions, including the Ubuntu Linux distribution.</p> <p>As with many Linux distributions, CentOS and Debian are generally more alike than different; it isn't until we dig a little deeper that we find where they branch.</p> <p><b>CentOS vs. Debian: Architecture</b></p> <p>The available supported architectures can be the determining factor as to whether a distro is a viable option or not. Debian and CentOS are both very popular for x86_64/AMD64, but what other archs are supported by each?</p> <p>Both Debian and CentOS support AArch64/ARM64, armhf/armhfp , i386 , ppc64el/ppc64le. (Note: armhf/armhfp and i386 are supported in CentOS 7 only.)</p> <p>CentOS 7 additionally supports POWER9 while Debian and CentOS 8 do not. CentOS 7 focuses on the x86_64/AMD64 architecture with the other archs released through the AltArch SIG (Alternate Architecture Special Interest Group) with CentOS 8 supporting x86_64/AMD64, AArch64 and ppc64le equally.</p> <p>Debian supports MIPSel, MIPS64el and s390x while CentOS does not. Much like CentOS 8, Debian does not favor one arch over another —all supported architectures are supported equally.</p> <p><b>CentOS vs. Debian: Package Management</b></p> <p>Most Linux distributions have some form of package manager nowadays, with some more complex and feature-rich than others.</p> <p>CentOS uses the RPM package format and YUM/DNF as the package manager.</p> <p>Debian uses the DEB package format and dpkg/APT as the package manager.</p>	

Both offer full-feature package management with network-based repository support, dependency checking and resolution, etc.. If you're familiar with one but not the other, you may have a little trouble switching over, but they're not overwhelmingly different. They both have similar features, just available through a different interface.

### Task 1: Download the CentOS or RHEL-8 image (Create screenshots of the following)

1. Download the image of the CentOS here:  
[http://mirror.rise.ph/centos/7.9.2009/isos/x86\\_64/](http://mirror.rise.ph/centos/7.9.2009/isos/x86_64/)
2. Create a VM machine with 2 Gb RAM and 20 Gb HD.
3. Install the downloaded image.
4. Show evidence that the OS was installed already.

### Task 2: Install the SSH server package `openssh`

1. Install the ssh server package `openssh` by using the `dnf` command:

`$ dnf install openssh-server`

```
[jroldan@vbox ~]$ dnf install openssh-server
Not root, Subscription Management repositories not updated
Error: This command has to be run with superuser privileges (under the root user
on most systems).
[jroldan@vbox ~]$ sudo dnf install openssh-server

We trust you have received the usual lecture from the local System
Administrator. It usually boils down to these three things:

    #1) Respect the privacy of others.
    #2) Think before you type.
    #3) With great power comes great responsibility.

[sudo] password for jroldan:
Sorry, try again.
[sudo] password for jroldan:
Updating Subscription Management repositories.
Unable to read consumer identity

This system is not registered with an entitlement server. You can use "rhc" or "
subscription-manager" to register.
```

```
jroldan@vbox:~
```

```
[sudo] password for jroldan:  
Sorry, try again.  
[sudo] password for jroldan:  
Updating Subscription Management repositories.  
Unable to read consumer identity  
  
This system is not registered with an entitlement server. You can use "rhc" or "subscription-manager" to register.  
  
CentOS Stream 9 - BaseOS 17 kB/s | 8.8 MB 08:45  
CentOS Stream 9 - AppStream 25 kB/s | 25 MB 16:50  
CentOS Stream 9 - Extras packages 3.5 kB/s | 19 kB 00:05  
Package openssh-server-8.7p1-43.el9.x86_64 is already installed.  
Dependencies resolved.

Upgrading:  
  openssh x86_64 8.7p1-46.el9 baseos 458 k  
  openssh-clients x86_64 8.7p1-46.el9 baseos 713 k  
  openssh-server x86_64 8.7p1-46.el9 baseos 457 k  
  
Transaction Summary  
=====
```

2. Start the **sshd** daemon and set to start after reboot:

```
$ systemctl start sshd
```

```
$ systemctl enable sshd
```

3. Confirm that the sshd daemon is up and running:

```
$ systemctl status sshd
```

```
jroldan@vbox:~$ systemctl start sshd  
[jroldan@vbox ~]$ systemctl enable sshd  
[jroldan@vbox ~]$ systemctl status sshd  
bash: system: command not found...  
[jroldan@vbox ~]$ systemctl status sshd  
● sshd.service - OpenSSH server daemon  
  Loaded: loaded (/usr/lib/systemd/system/sshd.service; enabled; preset: enabled)  
  Active: active (running) since Fri 2025-09-05 17:33:18 PST; 59s ago  
    Docs: man:sshd(8)  
          man:sshd_config(5)  
   Main PID: 6849 (sshd)  
     Tasks: 1 (limit: 10946)  
   Memory: 1.4M  
     CPU: 9ms  
    CGroup: /system.slice/sshd.service  
           └─6849 "sshd: /usr/sbin/sshd -D [listener] 0 of 10-100 startups"  
  
Sep 05 17:33:18 vbox systemd[1]: Starting OpenSSH server daemon...  
Sep 05 17:33:18 vbox sshd[6849]: Server listening on 0.0.0.0 port 22.  
Sep 05 17:33:18 vbox sshd[6849]: Server listening on :: port 22.  
Sep 05 17:33:18 vbox systemd[1]: Started OpenSSH server daemon.
```

4. Open the SSH port 22 to allow incoming traffic:

```
$ firewall-cmd --zone=public --permanent --add-service=ssh
```

```
$ firewall-cmd --reload
```

```
[jroldan@vbox ~]$ firewall-cmd --zone=public --permanent --add-service=ssh  
Warning: ALREADY_ENABLED: ssh  
success  
[jroldan@vbox ~]$ firewall-cmd --reload  
success
```

5. Locate the ssh server man config file */etc/ssh/sshd\_config* and perform custom configuration. Every time you make any change to the */etc/ssh/sshd-config* configuration file reload the *sshd* service to apply changes:

```
$ systemctl reload sshd
```

### Task 3: Copy the Public Key to CentOS

1. Make sure that *ssh* is installed on the local machine.
2. Using the command *ssh-copy-id*, connect your local machine to CentOS.
3. On CentOS, verify that you have the *authorized\_keys*.

```
roldan@workstation:~$ sudo nano /etc/hosts
[sudo] password for roldan:
Sorry, try again.
[sudo] password for roldan:
roldan@workstation:~$ ssh-copy-id -i ~/.ssh/id_rsa jroldan@centos-server
/usr/bin/ssh-copy-id: INFO: Source of key(s) to be installed: "/home/roldan/.ssh/id_rsa.pub"
The authenticity of host 'centos-server (192.168.56.122)' can't be established.
ED25519 key fingerprint is SHA256:HnsdgojNFMFkBk5W083PMysqlUYqQLbAiz3Q3Wrn1Sa4.
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
/usr/bin/ssh-copy-id: INFO: attempting to log in with the new key(s), to filter
out any that are already installed
/usr/bin/ssh-copy-id: INFO: 1 key(s) remain to be installed -- if you are prompt
ed now it is to install the new keys
jroldan@centos-server's password:

Number of key(s) added: 1

Now try logging into the machine, with: "ssh 'jroldan@centos-server'"
and check to make sure that only the key(s) you wanted were added.

roldan@workstation:~$ ssh jroldan@centos-server
Activate the web console with: systemctl enable --now cockpit.socket
```

#### Task 4: Verify ssh remote connection

1. Using your local machine, connect to CentOS using ssh.
2. Show evidence that you are connected.

```
roldan@workstation:~$ ssh jroldan@centos-server
Activate the web console with: systemctl enable --now cockpit.socket

Last login: Fri Sep  5 17:53:02 2025
[jroldan@centos-server ~]$ logout
Connection to centos-server closed.
roldan@workstation:~$ S
```

#### Reflections:

Answer the following:

1. What do you think we should look for in choosing the best distribution between Debian and Red Hat Linux distributions?
  - Debian is a good choice if you just want something free, adaptable, and stable to use in a personal or small project. It is open-source and provides you a good

amount of control over your system, but is not professionally supported. However, Red Hat is better in case you are working in a business or enterprise environment where you require certain guarantees, stability over time, and strong security options.

2. What are the main differences between Debian and Red Hat Linux distributions?

- Debian is free, flexible and suited to personal use or smaller projects, but lacks official support. Red Hat is designed with businesses in mind and provides large systems security, tools, and support on a professional basis. Thus, Debian is lighter and Red Hats is a more reliable one at the enterprise level.
